

Temperature affects the creativity of responses from AI models. Using a lower temperature means the model will give more factual answers so for the document querying project a lower temperature performs better, however if the model needs to do creative tasks then a higher temperature is better since the model output will be more random and thus more creative. Top P sorts tokens by how probable it is for the AI to use and the higher this is means the higher the word choice the AI has and if this is low then the word choice isn't as big.
